## ALUMINUM TRANSMISSION & ENGINE CLEANER

Aluminum Transmission & Engine Cleaner is a concentrated, completely soluble powder designed to function most effectively at elevated temperatures. It cleans and strips away oil grease and other deposits from transmissions, radiators, and other metal parts without foaming problems. It will not leave a film or residue on parts and it will not plug up spray cabinet's jets, or build up inside parts washer cabinet.

Mineral spirits contains volatile organic compounds (VOCs) that contribute to smog formation and may be toxic when inhaled. The public will benefit from the overall reduction in VOCs emitted to the air as facilities switch from high VOC solvents to aqueous cleaners.

### PRODUCT FEATURES

- Dry parts immediately after cleaning to prevent flash rusting
- Use oil skimming to extend solution life
- Use filtration to extend solution life

### APPLICATIONS

- Auto repair shops
- Bus facilities
- Rail maintenance facilities

### CLEANING PERFORMANCE & TIPS

Aluminum Transmission & Engine Cleaner removes grease, dirt and grime from engine parts and mechanical equipment. It also maintains cleaning station for clean-and-replace operations. For those shops that don't subcontract out the cleaning service of transmissions or carburetors, this product is an ideal solution. It is also safe for cleaning both aluminum and cast iron parts that are in the spray cabinet together.

Aqueous cleaning can reduce costs by decreasing the amount of hazardous waste generated and by cutting back the amount of chemical purchased. Additionally, a water-based cleaning solution lasts four to twelve times longer than solvents before requiring disposal.
