ACTIVE INGREDIENTS

PYRETHRINS

A natural extract of the Chrysanthemum flower used as an ingredient in insecticides for fast knockdown. It kills on contact by causing paralysis. Offers low toxicity to humans and most warm-blooded animals.

SYNTHETIC PYRETHRINS

Provides the same benefits as natural pyrethrins but are less expensive to produce. They were developed due to a shortage of natural pyrethrins in the '70s. Examples include Sumithrin, Tetramethrin, Permethrin and Phenothrin.

SYNERGIST

An ingredient in insecticides which enhances the effectiveness of other ingredients. Synergists allow other ingredients to perform at a higher level than they normally would on their own. Piperonyl Butoxide is a common synergist added to insecticides.

DEET

The most widely used repellent in the world. Superior to other repellents such as smokes or fragrant ingredients.

SILICON DIOXIDE

Dehydrates insects to death by eliminating needed moisture from their bodies. Powder clings to insects and is spread to entire nest.

d-LIMONENE

All-natural orange peel extract originally used as a solvent cleaner. Found to be an excellent contact and residual insecticide safe for use around children and food. Suffocates insects to death by stripping away a protective wax coating from their exoskeletons.
